

Identity & Access Management (IAM)

Who is allowed to access what systems? How do you know who has access to what systems? What is IAM? Do you have a single “source of truth” when it comes to staff identity and accessing your corporate information or multiple user databases for different systems? These are the questions that all organisations should be asking around their existing Identity and Access Management (IAM) tools and processes and whether they have them addressed.

With the adoption of technologies such as mobility and cloud gaining momentum, the traditional enterprise perimeter is dissolving. What this means for an organisation is that its employees are becoming more mobile and their partners are becoming more involved in their day-to-day business processes. Integration becomes critical and it is paramount that central controls exist to ensure the correct access policy is applied for users across all accessible systems, both internally and externally to your organisation.

A well planned IAM architecture will ensure a seamless and transparent access to systems for those staff and trusted third parties who should have access. A poorly planned IAM will inevitably lead to multiple user databases for disparate systems

Enterprises need to ask themselves whether they have a strategy to handle their immediate and future IAM requirements. This is where Respiro can lend a hand. With years of experience in delivering IAM strategies to our customers, our expertise can help you write policy and deliver an IAM architecture that is flexible and ensures that your organisation can seamlessly and effortlessly control access from within its bounds authenticate and manage user identities and credentials across your organization’s physical, mobile, and cloud-computing environments.

It is paramount to have an effective IAM architecture in place which allows for your organisation to seamlessly interface with new systems and third parties whilst maintaining:

- The correct access policies based on users and groups
- Allowing access seamlessly to clients ensuring a troublefree user experience

With more and more organisations moving parts of their IT business into the cloud, maintaining a single source of truth for enabling a seamless and transparent user access experience is becoming more and more difficult.

Integration is critical, provided you keep tabs on who’s using your system, how they authenticate, and what information and applications they get into. Improve your organization’s productivity and security by giving your mobile workers, devices, and connected machines secure and easy access to assets, so work can flow.

Our processes have been developed over numerous years..

Identity and Access Management services help you authenticate and manage user identities and credentials across your organization’s physical, mobile, and cloud-computing environments. These services allow you to provide secure access to enterprise resources from virtually any location or device. Plus, you can also provide your machine-to-machine (M2M) connections with a secure entry point into your enterprise, which helps protect the data they collect and transmit.
